- Selection of the probands – volunteers was conducted by a dermatologist in accordance with the Helsinki Declaration of 1964 (with later amendments), the Polish law, EU, COLIPA guide lines using inclusion and exclusion criteria.

THE DERMATOLOGIC RESEARCH

/Path Test/

In order to execute a diagnostic test regarding harmlessness of the influence on human skin and showing a possible toxic-irritant or sensitizing characteristic of the delivered „ARGAN OIL – ACEITE DE ARGAN AIRLESS /labelled as „Aceite de Argan”/”, a diagnostic test with 30 persons was conducted: 18 women and 12 men of the age between 21 – 61 years old. The participants were informed, not to use any anti – histamin pharmacological medicine in this time, which could affect the outcome of the research. The skin of the participants and their subjective impressions were evaluated before the preparation's application, during and after the doctors-specialists of dermatology finished the research. With the above mentioned preparation epidermal patch tests were conducted. Exposition of the tests lasted 48 hours. The results of the patch tests were read after 48 and 72 hours from the application time.

The results:

All results of the patch tests were **negative.**

CONCLUSIONS

- Based on the entirety of the conducted research there were no findings for symptoms, which would implicate a harmful, i.e. allergic or toxic-irritant influence of the tested „ARGAN OIL – ACEITE DEARGAN AIRLESS /labelled as „Aceite de Argan”/” on skin – path tests negative.
- The issued opinion does not apply to anybody with an allergy to any of the ingredients of the tested preparation.
- The tested preparation fulfills requirements for cosmetic products of declared specifications, i.e. hypo – allergic in regards to human health safety /Act of 30th March 2001 about cosmetics in terms of article 11, act 1, point 4/.
